Day 2: Variant detection pipeline

Loose ends; why code vs results

▶ No one asked me this why?

Different backup policies

- `results` files are
  - usually huge so can not backup very often
  - usually (should be) regenerable from the files in `code` and the raw data
- stuff in `code` is usually very precious and is being modified so basically what to back it up or snapshot it as often as possible.
  - `code` + data is in a sense a backup of `results`.
  - and `code` is usually small so can afford to back it up
- By separating the two make it possible to have different backup policies for each.

VC; snapshotting

Everyone do

```
cd ~/Day45
cat >.gitignore
results
^D #This means type a control-D

git init
git add .
git commit -m "initial check"
```
